

Lessons Learned on Coding Practices for Science Software

EOSDIS Technology Transfer Workshop November 13-17, 1995

Author:E.J.Medeiros Computer Sciences Corporation
Development Technical Representative: E.A.Pumphrey GSFC Code 505
beth.pumphrey@gsfc.nasa.gov
Prototype Lead: S.J.Kempler GSFC Code 505
steven.j.kempler@gsfc.nasa.gov

NASA/Goddard Space Flight Center

Objective

- To develop a set of suggested software practices
 - based on the lessons learned from other NASA and government development efforts
 - which promote life cycle costs
 - for science software developers
 - to ease integration with ECS
 - to aid execution efficiency within the ECS environment
- To organize the document to accommodate multiple points of view of the readers
 - software goals
 - software practices
 - lessons learned

Approach

- Gather lessons learned in science software integration from other NASA and government projects.
- Gather lessons learned in software porting of C and Fortran code under Unix from several sources.
- Develop suggested programming practices which reflect the gathered lessons learned. Show traceability.
- Specify which practices are reflected in the ESDIS Standards and Guidelines.
- Categorize and organize the suggested practices in prioritized terms of software goals such as portability, maintainability, useability, reuseability, and adaptability.
- Survey COTS and other tools which support the resulting suggested programming practices.
- Present initial results as a white paper. Convert white paper to hypertext format for community availability.

Status

- White paper was delivered to ESDIS 9/95.
- Final ESDIS review is nearly complete.
- Hypertext version has been developed.

Next Steps

- Incorporate final ESDIS comments into both the white paper and hypertext versions.
- Announce document availability to the community of science software developers by December 31, 1995.
- Encourage user feedback to ensure a living document.
